In the 1990s, the user base for AutoCAD Free Download expanded to include many programmers and CAD designers with a PC on their desk. The AutoCAD 2000 platform was released in 1995, and the “industry standard” for computer-aided drafting until about 2000 was STEP, first defined in 1989. Autodesk took an active role in STEP for many years, and much of the Autodesk AutoCAD platform was based on STEP. AutoCAD versions before 2000 were released for Macintosh platforms. AutoCAD Architecture AutoCAD is a multithreaded, cross-platform, 32- or 64-bit, rich-formatted, object-modeling application. It was first introduced as a single-threaded 16-bit application running on the 286 processor architecture. Since then, the object-modeling architecture and features of AutoCAD have become increasingly powerful. Each AutoCAD file contains a single file with object, layer, and graphics data. The system stores all data, including comments and styles, in this single file. All user-generated data is stored in this file. The unique feature of AutoCAD, and what distinguishes it from many other CAD programs, is that a drawing object is composed of two or more objects. When you create an object, you create a group of objects. AutoCAD model A drawing in AutoCAD is represented by a model. When you create an object, a single object is created in the model. The object is stored in a drawing file in the default drawing unit. When you insert, move, or copy an object, it is moved to the default drawing unit. The default drawing unit is the unit in which the object is inserted, when you do a Save As operation or on importation. Figure 3. The simplest object is a line. Other objects are also created in the model and stored in drawing files. In a drawing, each object is represented by a group. These objects can be related to each other in the model. The objects in a group can be referenced to other groups, and the objects in the group can be inserted, removed, moved, or copied. Object Groups An object group is the basis for all objects in the model. A group is defined by a name and one or more properties, such as lines, paths, or dimension styles. A group is not an object. It is a container for

Atomic-scale nanocrystalline zirconia film for the sensing of air-borne pathogens. In the present study, atomic-scale nanocrystalline zirconia (NCZ) films were successfully prepared by the hydrothermal treatment of zirconium precursor and a facile and novel aerosol assisted sol-gel (AAS) method. Zirconia samples synthesized by the AAS method have a grain size of 5-10 nm and a morphology of nano-spherical particles. The aerosol-assisted sol-gel method improved the nucleation rate of zirconia samples, and the chemical affinity between zirconia precursor and aerosol species during the in situ aerosol formation was found to be
