* **Photoshop Elements:** The _Elements_ program offers much of the same functionality as the full version of Photoshop, but with more limitations. It includes basic image-editing tools, including the Rotate and Resize tool, most of the advanced tools found in PS, and the Pantone color-matching tool. * **GIMP:** One of the best free image-manipulation programs is called GIMP. In fact, it's a strong rival to Photoshop. The same people who designed Photoshop created GIMP. The only difficulty with GIMP is that it's not always as easy to get things done as it is with Photoshop. * **Sketch:** A popular and easy-to-use program is the inexpensive program called Sketch. This is a good alternative for people who aren't ready to go to Photoshop or are trying their hand at editing for the first time. If you're a beginning Photoshop user, you may want to choose Photoshop Elements instead of the full version of Photoshop. ## Selecting and Saving After you're ready to save an image, you must select the format for the final output. The following list gives you an overview of the various standard image formats. You can access these formats by clicking on the File tab on the Photoshop window and choosing File⇒Save As. * **TIFF/TIF:** This is a good format for creating high-quality prints from the web. This format preserves all the good aspects of the image, including color, highlights, and so on. * **JPEG/JPG:** This is a good format for making viewing images on your computer easier and for other uses. Use this format for reducing the size of your original image by more than 80 percent and for making an electronic file. * **PSD:** This is a good format to use for saving editable files such as vector images or illustrations. * **PDF:** This is a good format for printing, but it's best to use a high-quality PDF printer (not just a standard inkjet printer). * **BMP:** This is a good format for creating images that you want to share on a website.

ans in Israel and many other countries have had contact with the new strain of coronavirus (ICTV definition: 2019-nCoV) initially thought to be the cause of the pneumonia outbreak in Wuhan, China. The links between the outbreak of SARS-CoV-2 and those transmitted by bats in the Bangerang population in Southeast Asia are being investigated. Veterinary diagnostics are the cornerstone of human and animal health, with unique purposes, which may vary from curative purposes to preventive purposes. The zoonotic potential of new emerging viruses, such as IBV, SARS-CoV, HCoV-229E and HCoV-OC43, amongst others, highlights the importance of developing and implementing early detection and rapid response systems for viral diseases in animal populations. In this issue of the ***Annals of the Hellenic Veterinary Society***, Ioannis Touliatos et al. describe the results of a study to investigate the presence of viral haemorrhagic diseases in dogs from a shelter in Kastoria, Greece. In a time of greatly reduced animal-related tourism and restrictions on the movement of animals within the European Union, this highlights the veterinary importance of this study. There are no known cases of the new SARS-CoV-2 infections in dogs in Europe, although it would be logical to assume that some animals will have similar infection rates or will become ill, and will require veterinary intervention. Fortunately, unlike other viruses such as SARS-CoV, there is no human-to-animal health risk and the number of dogs infected with this virus is very low. The husbandry of livestock has always been an important part of human agriculture. Poultry, in particular, has been grown on a very large scale. The growth in the demand for meat has been large, with chicken the principal meat, with pork in some countries and lamb and beef in others, and this demand is still increasing. Meat production has always had a close relationship with vaccination, which has been used to prevent infectious diseases. Poultry vaccination is designed to prevent a number of infectious diseases, including reoviruses, Newcastle disease, infectious bronchitis, *Mycoplasma gallisepticum*, *Mycoplasma synoviae*, avian cholera and avian influenza. Vaccination has been used for many years, and in the past, subunit vaccines have been given. More recently, acellular
