Adjust Laptop Brightness Download

Developed by Fabio Tosatti, Adjust Laptop Brightness is a simple program that helps users set custom brightness levels for their computers. Adjust Laptop Brightness supports most Intel, AMD, and VIA based motherboards and laptops. The installation procedure is simple and does not require additional steps. You can customize the slider's placement (left/center/right), set the minimum/maximum brightness levels (in RGB) and choose whether the monitor's brightness should be turned on at startup. The app can also be run at system startup and has its own icon in the system tray. Program's interface: As its name implies, the application provides an easy-to-use interface with a small vertical slider that you can move to increase and decrease brightness instantly. When you launch the app, you will see a small frame with a slider that covers the entire desktop screen. On the far right, you will see the "Options" panel, where you can set Adjust Laptop Brightness to auto-adjust monitor brightness on system startup, to always show the slider in the center of the screen, to fade the slider after a specific time, and so on. On top of that, the application can be configured to support screen calibration, in which case a picture of the calibrated monitor's backlight and a white-filled square representing the menu's background will appear whenever you select a brightness setting, or the app will always show the backlight picture as a background. Also, Adjust Laptop Brightness will support a special mode of operation in which it will be automatically launched on system startup if it is not running (though not configured to always launch). The "Options" panel: In the Options panel, you will be able to specify whether Adjust Laptop Brightness will be started at system startup or not, to set minimum and maximum brightness levels, and to choose whether the monitor's brightness should be turned on at system startup. Here is a list of available options: - Startup - Auto-adjust brightness at startup - Always show slider in the center - Auto-hide the slider - Show white square as a background - Start at a specific time - Auto-launch on startup - Restore backlight at startup - Save current backlight setting - Test - Refresh - Settings A: Take a look at Brightness Control for KDE, available in the kpackage manager in Kubuntu. Adjust Laptop Brightness X64

Keymacro is a very simple application that generates keys, which you can use to access any website. It supports both hotkeys and mouse macro emulation. There are many key customization options, including a choice between different keyboard layouts, keyboard settings, and mouse buttons assignments. Keymacro supports seven different keyboard layouts (including English, Greek, Finnish, Chinese, Russian, Czech, and Hungarian). The

app comes with a number of hotkeys activated by default: Ctrl+F6 to scroll pages up, Ctrl+F7 to scroll pages down, Ctrl+F8 to close a page, Ctrl+F9 to go to the top of a page, Ctrl+Shift+F9 to go to the bottom of a page, Ctrl+Shift+F10 to go to the next page, and Ctrl+Shift+F11 to go to the previous page. Of course, users can add their own custom hotkeys and mouse macros. To do this, you can create macros using your standard keystroke and mouse button combinations, assign them, and manage them as you wish. You can also assign any mouse button to a hotkey, or have the mouse change to its other side while pressing a hotkey. Like most other keystroke, you can also change the number of rows and columns of the keyboard layout when hotkeys are triggered, and the page size when macros are activated. Keymacro is a very simple application that generates keys, which you can use to access any website. It supports both hotkeys and mouse macro emulation. There are many key customization options, including a choice between different keyboard layouts, keyboard settings, and mouse buttons assignments. Keymacro supports seven different keyboard layouts (including English, Greek, Finnish, Chinese, Russian, Czech, and Hungarian). To do this, you can create macros using your standard keystroke and mouse button combinations, assign them, and manage them as you wish. You can also assign

Adjust Laptop Brightness is a very simple application that helps users seamlessly tweak the brightness level of their laptops. Contrary to what its name implies, the tool works for desktop computers as well. The installation procedure takes little time to finish. The interface consists of a small, vertical frame with a slider that you can move to increase and decrease brightness instantly. At startup, Adjust Laptop Brightness creates an icon in the system tray area, whose context menu contains several program options (also available in the frame's right-click menu). So, you can restore brightness to default level, select the minimum or maximum value, hide the slider, as well as turn off the monitor. Double-clicking the app's icon in the slider brings up an "Options" panel where you can set Adjust Laptop Brightness to calibrate monitor brightness on system startup, always show the slider in the center of the screen, fade the slider after specific time (defined by the user), and so on. The app works well and does not put a strain on PC performance, since it uses minimum CPU and RAM. However, the lowest brightness level recorded by Adjust Laptop Brightness is the monitor's current one, thus forcing the user to fiddle with the monitor buttons to lower it beyond that level. On top of that, the installer creates an additional link on the desktop that directs users to the developer's website, without giving any warning beforehand (let alone integrate an option for dismissing it from setup). The presented features do not justify Adjust Laptop Brightness's high pricing. [ 4/5 ] Adjust Laptop Brightness Rating: 10 out of 10 1 user rating Make sure to vote for Adjust Laptop Brightness Your name Your e-mail Enter a comment and click submit. Thank you for the vote! Thanks for voting! Free Software Applications and games are created and distributed under a free software license. Free software license does not restrict usage of the software, but gives the users the freedom to modify and change it as they wish, giving them the very freedoms originally intended by the author of the software. With free software, you get the full source code of the program. With this source code, you can compile it into a binary file, redistribute it to others, or adapt it to your needs.
