Regardless of your Photoshop preferences, you'll want to use Photoshop Camera Raw. It's the best utility for handling JPEG and TIFF images, whereas Camera Raw – the other default Photoshop application – is built for RAW. For example, Camera Raw lets you access your different camera settings and makes it easier to adjust them, while Photoshop CS6 still doesn't include an easy way to apply highlight and shadow adjustments. Even if you use both Photoshop and Lightroom on your computer, you'll want to stick with Camera Raw when editing your images. So in the end, why do I think that Lightroom 4 is better? For one thing, it's easier to install the application. The "Help" menu functions and even the manual are quite intuitive for someone who is new to Lightroom. Shooting images is also faster. In fact, only 21 seconds or so were required for my 1,400-megapixel sunset photo. As for what I like about Lightroom 4, well, there's quite a bit. I mentioned in the beginning that the most important features are well made, so let me give Lightroom 4 a few honorable mentions. As I noted before, it's easier to use and works pretty well on both Windows and Mac computers. I also like the auto imports and exports, the ability to easily search through my photo collections, and the quicker, more intuitive drag and drop of photo stacks and presets. The application also is much better suited to the X-series sensor-based Fujifilm cameras. In fact, they're actually fairly similar in terms of performance. Regardless of how much you shoot, I highly recommend Lightroom 4.

You can apply new filters to an image in real time and create unique new effects and compositions. Adobe Sensei allows Photoshop to create filters that use data and descriptions taken from the image. These filters work both collaboratively and independently, and enable you to apply advanced commands like "edit the white balance to add color" or "correct the sharpness of the image." In addition to enabling Photoshop to create new filters, Sensei-powered filters also extend the toolset available to users, so you can now use adjustments such as Hue/Saturation, Curves, Vibrancy, Gradient Filter and more.
